WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, (Form 86ab) rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is promptly requested and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per 1000 mean strength which would occur over a year's time if the current week's experience continued through the year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases of the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per 1000 strength, as given in this report, furnishes an approximation to the current non-effective rate. The mean number of non-effectives per 1000 strength is given in the summary table for the total United States and for each of the Service Commands.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large load of venereal diseases among newly inducted men. More significant of high morbidity from disease are, therefore, the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds currently reported as "expansion beds", beds in dispensaries, convalescent facilities, venereal disease facilities, and college training detachments are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of (by death, return to duty, transfer, or otherwise) during the week, the number of such patients remaining at the end of the week, and corresponding data for battle casualties. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week, i.e., admissions by transfer less the dispositions by transfer. For the country as a whole, this number represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) has been placed after admission rates computed on the basis of 5 or fewer cases.

The symbol # has been placed after the names of stations (or groups of stations) where part or all of the data for the current week has not been received and the latest available figures have been substituted.

WEEKLY HEALTH REPORT

WEEK ENDING 27 NOVEMBER 1943

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated on the chart on page 3, the admission rates from all causes and from all diseases combined both increased for the second successive week, as a result of another very sharp increase in the admission rate from colds, influenza, etc. It may be noted, however, that the rise in the admission rate from all diseases combined was only about half that in the admission rate from colds, influenza, etc; this suggests that there was probably some tendency in stations where influenza occurred with greater frequency to report also ill-defined disorders accompanied by fever as influenza.

Despite the very sharp increase in the admission rate from colds, influenza etc., the current week's morbidity from this cause is about 17 percent below that reported for the corresponding week last year.

The admission rates from all causes and from all diseases combined for the week ending 27 November 1943, were both about 5 percent below the corresponding morbidity rates reported for the last week of November 1942. The current week's admission rate from injury was the lowest in recent months, and somewhat under that for the corresponding week last year.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

Very sharp increases in the admission rate from colds and influenza in the Sixth, Seventh, Fifth, Second, and Third Service Commands were reflected in markedly higher morbidity rates from all causes and from all diseases combined. In the Sixth Service Command the admission rate from colds and influenza for the week ending 27 November 1943 was reported to be over 600 per thousand and that in the Seventh Service Command over 450 per thousand. In the Seventh, Fifth, Second, and Third Service Commands the increases in the admission rates from colds, influenza etc. were considerably greater than the corresponding increases in the admission rates from all diseases combined.

The smallest increases in admission rates from colds and influenza were reported from the Eighth and Ninth Service Commands, in which the admission rates from all causes and all diseases combined decreased slightly.

CURRENT HOSPITALIZATION CONDITIONS

The total bed capacity remained approximately the same, being reported at about 355,000 on 27 November 1943. The number of beds occupied on that date was slightly over 189,000 and the number of "available vacant" beds almost 96,000. There were 36 stations with a total bed capacity of nearly 26,000 which had no "available vacant" beds; included among them were 7 general hospitals with a bed capacity of over 12,500 beds.

On 27 November 1943, there were 1,888 cases of malaria remaining under treatment, all but 32 of which were presumably acquired outside of the United States. The number of neuropsychiatric cases remaining under treatment at the end of the week was 17,600.
